Lesson 40 material: Argument: A Model Essay and the Rhetorical Appeals

English Stage 3 (C1) · Unit 5: Argument and Academic Style

5.1: Introduction

From *Reading, Writing, Research, and Reasoning: An Advanced ESL Text* by Gabriel Winer and Elizabeth Wadell, ASCCC Open Educational Resources Initiative (CC BY-NC 4.0). This section: CC BY-NC 4.0; authored, remixed or curated by Gabriel Winer and Elizabeth Wadell (ASCCC Open Educational Resources Initiative (OERI)).

Changes: formatted for print; exercise answers are in the study guide.

What will we learn in this chapter?

In this chapter, you'll learn about argumentation: different methods writers use to get their readers to believe an idea or take an action. You will study the parts of these methods of argument, practice identifying them in texts that you read, and decide if a writer's arguments are logical, fair, and strong. You will practice using a special set of academic English vocabulary to name an argument's parts, strengths, and weaknesses, and to build and defend your own arguments.

Why is this important?

Analyzing arguments in texts you read will help you deeply understand different perspectives on a topic or problem. You'll also build your ability to apply these strategies to your own writing in English, so you can better convince your readers to share your ideas and inspire them to take action. Analyzing arguments and writing your own effective arguments will help you succeed in every other academic discipline in addition to English classes. It's the doorway to participating in what academics call The Great Conversation: the ongoing discussion of what ideas are true and how we know this. It's also crucial to success in your career and will help you participate in civic life in English.

What theme will this chapter focus on?

"Fast fashion" is a name that describes clothing produced quickly and cheaply, following the latest design trends, that is intended to meet consumer demand but not made to last. The industry has grown quickly in recent years, and brings up several controversial ethical issues: producing clothing in this manner causes environmental damage through pollution and wasted resources, and results in unfair labor practices. However, people need affordable clothing, and attempts to reduce the harms of the industry through laws and boycotts sometimes have unintended negative consequences. The readings in this chapter explore these issues and demonstrate different elements of and strategies for argumentation.

Learning objectives

In this chapter, you will learn to

- identify, evaluate, and write the three types of rhetorical appeals (ethos, pathos, and logos).
- identify the parts of, evaluate, and write deductive logical arguments.
- identify, explain, and refute common logical fallacies.
- identify, evaluate, and write concessions and counterarguments.
- identify and use hedging language.

Deadly Fashion

My $9.99 t-shirt is no longer wearable after two washes: the shape of the shirt is so distorted that it does not fit me well anymore. One might say I got what I paid for, because the poorly constructed t-shirt is from a “fast fashion” store. Fast fashion is a term for the companies like H&M, Zara, and Uniqlo that sell clothes that copy the trendy appeal of high-end brands but at an affordable price, usually because they are made in countries with low labor costs like India, Bangladesh, Cambodia, and China. Fast fashion prices are so low, explains anthropologist and marketing professor Annamma Joy, that consumers feel encouraged to dispose of a garment after a few wearings and buy a new piece (274). This leads to an increase in sales for new clothing. In fact, According to journalist Rachel Monroe, “Worldwide, clothing production doubled from 2000 to 2015, while prices dropped: We were spending the same amount on clothes, but getting nearly twice as many items for it.” This increase in value for customers has a steep price, even if we can't see it in the store. Before tossing my t-shirt in a donation bag, I wonder about the person who sewed it. Who is this person? How good or bad are their working conditions? What about the cost of pollution? Although some defend the fast fashion industry’s aesthetic and economic contributions, it has devastating impacts on labor rights and the environment, and needs serious regulations by all nations to stop the damage.

One glaring consequence of the demand for cheap clothing is that factory workers get paid too little, while their requests for living wages are ignored. Cheap labor is a reason that many apparel corporations move their production overseas. As Adam Matthews reports, by 2016, only 3% of clothes sold in the U.S. were made in this country. This shift to foreign production is the direct result of lower labor costs. According to Deborah Drew, an associate at the World Resource Institute’s Center for Sustainable Business, women garment workers in Bangladesh are paid about $96 per month; however, the government estimates $336 dollars as a minimum level for workers to afford their basic needs. Based on these statistics, women are paid less than a third of a necessary living wage. Garment workers in other developing countries suffer similarly: they work long hours but remain in poverty. Business owners and their powerful organizations dismiss the demands of factory laborers for raises because they claim that paying more will lead to factory closures. In fact, in recent negotiations, some are trying to impose even worse pay. Ken Loo, secretary-general of the Garment Manufacturers Association of Cambodia, defended the employers’ proposal to reduce wages by 4.5 percent. He “pointed to the economic effects of COVID-19 and said garment industry employers can’t afford to spend more on labor” (Sovuthy). His statement reflects the belief that the workers’ lives and well-being are not important compared to the continuing profits of the owners and investors. Most reasonable people would not agree with that idea, but most of us still shop for cheap clothing. We can’t depend on the individual fairness of factory owners, or on individual consumers to solve this problem; that’s why regulations are critical.

Besides low wages, workers in the clothing factories also suffer terrible working conditions. Singular tragic events such as the Rana Plaza factory collapse in 2013 that killed over a thousand workers make worldwide news (Rahman and Rahman 1331), but the daily experiences of the people making cheap clothing are also unacceptable. According to Sadika Akhter, an anthropologist and doctor of Environmental Public Health and her colleagues, garment workers in Bangladesh typically work ten to twelve hours per day, inhaling fabric dust, enduring extreme heat, and getting repetitive motion injuries from using the machines. They are constantly in pain and exhausted. In their qualitative study of women garment workers’ experiences, Akhter et al. quote a machine operator who says, “We sew shirts with our tears and injure our fingers due to needle punctures. If you work at the garment factory it will give you some money but it will take your health. . . . No one can work in a factory more than ten years because you will lose your physical strength, energy and health . . . due to the nature of hard work in this industry." This statement emphasizes how exploited these workers are; their bodies are being damaged every day. The people, not just the clothing, are treated as if they are disposable.

It is true that the industry has made some progress in improving labor rights. Sociology professor Shahidur Rahman of BRAC University, and professor of Development Studies Kazi Mahmudur of University of Liberal Arts Bangladesh describe some attempts at reform following the Rana Plaza disaster in 2013 in their article in *Development and Change*. According to Rahman and Rahman, two major agreements, the Accord on Fire and Building Safety in Bangladesh and the Alliance for Bangladesh Workers' Safety brought together business owners and governments to improve the safety of factory buildings (1332). The Bangladeshi government also made changes to labor laws to allow workers to organize, and other international unions and non-governmental organizations have campaigned for worker rights in the industry (Rahman and Rahman 1333). These developments are positive—at least workers are less likely to die in a fire or building collapse. However, the inhumane daily conditions and low pay remain, even eight years after these agreements were made.

Beyond the conditions inside the factories, the production of cheap clothing causes significant pollution. The problems begin with the raw materials: synthetic fibers are made from petroleum, and although plant fibers are considered more natural, growing plants to use for fabric has its own problems. Research scientist Luz Claudio writes that cotton is "one of the most water and pesticide dependent crops (A450). Despite the fact that more consumers are choosing organic produce over conventional because of the concern about pesticide residue on fruits and vegetables, this trend is not extending to crops grown for fabrics. In fact, pesticide use on cotton fields is actually growing, along with its negative impact on farm workers, according to an

international team of scientists from Pakistan and Greece (Khan and Damala 9). This problem is not limited to the countries where clothing is sewn; the U.S. Department of Agriculture reports that the usage of pesticides to produce cotton is a quarter of the entire pesticide used in this country (qtd. in Claudio, A450). Furthermore, when fabric is processed and dyed in factories overseas it can lead to significant water pollution. According to investigative reporter Adam Matthews, water that runs off from the factories contaminates rivers that are the lifeline for farmers, killing crops and sickening local residents and animals. Yixiu Wu of Greenpeace points out that "the average pair of jeans requires 1,850 gallons of water to process; a t-shirt requires 715 gallons. And after going through the manufacturing process, all that water often ends up horribly polluted" (qtd. in Matthews). In addition to water pollution, the fashion industry produces at least a tenth of the world's carbon emissions, says journalist Dana Thomas (qtd. in Shatzman). Still, most retail corporations do little to address these harms, because their profits are higher when they spend less money ensuring that crops are grown without poisons and that the waste products are properly disposed of.

Despite the clear injustices and environmental harms of garment production, some argue that the fashion industry provides work to people with few better choices in developing countries. According to reporter Stephanie Vatz, companies began outsourcing clothing manufacturing jobs in the 1970s, and by 2013, only two percent of clothing was made in the U.S. The same lack of labor protections that allow terrible working conditions in developing countries also guarantees low labor costs that motivate U.S. companies to relocate their factory sources (Vatz). Some claim that this is actually a benefit to those workers. For example, Benjamin Powell, the director of the Free Market Institute, justifies sweatshop labor, insists that this model is "part of the process that raises living standards and leads to better working conditions and development over time (qtd. in Ozdamar-Ertekin 3). This argument is compelling from a distance, but even if it may be true to some degree when we look at the history of economic development, it disregards the humanity of current garment workers. These people continue to work long hours in brutal conditions, generating huge profits for the factory and retail owners. Making the excuse that their lives could be even worse without this exploitation is just a cynical justification for greed.

Fast fashion brands focus almost entirely on financial gain and ignore social responsibility and workers' human rights. They turn a blind eye to polluting rivers, the impact on farmland, and poor labor conditions. As a consumer of fast fashion brands, this is troubling. As a person considering fashion as a part of history, a form of art and self-expression, this is beyond sad. A bad sewing job is an inconvenience for me, but unethical practices are the real issue. If there is something we can change, that is our behavior as consumers: we need to buy second-hand clothes, look for companies making apparel here in the U.S., and be willing to pay more for higher-quality clothing that lasts. However, ultimately this is not just a question of our own purchasing decisions. Major changes are needed in the system, and for that we need stronger government regulations to ensure real change.

Changes: formatted for print; exercise answers are in the study guide.

What is rhetoric?

- How do we know what we should believe?
- How do we convince another person to do or believe something?
- How do we know when someone is making an unfair or unbelievable argument?

Think about the last few decisions you made—big decisions like moving or changing jobs, or smaller ones like buying a pair of shoes. Did you mostly listen to your heart, use the opinions of trusted sources, or add up all the facts? Or some combination of these three ways of knowing what to decide? When you are writing an argument, you are helping your readers make a decision: the decision to agree with you, to understand, accept, and perhaps act on your main idea. You can appeal to their hearts, their trust, and their logic to encourage them to agree with you.

Rhetoric is the study of the art of persuasion and of how we apply that art to effective speaking and writing.

What are the 3 main rhetorical appeals?

Aristotle, the famous Greek philosopher, described three ways of communicating that writers and speakers use to persuade their audience (get other people to agree with them). He called these the three **rhetorical appeals**: pathos, ethos, and logos.

- **Pathos** is about feelings—the writer connects to readers' values through emotion, senses, and story. (See Figure 5.3.1)
- **Ethos** is about credibility—the writer builds trust by presenting their argument fairly and thoughtfully, and by using information from other expert sources. (See Figure 5.3.2)
- **Logos** is about logic—the writer sets up a solid structure of reasons with evidence. (See Figure 5.3.3)

(Picture: black and white heart-shaped print with a fingerprint pattern)

To write an effective argumentative essay, you need to use all three appeals. And knowing more about how they work provides a framework to help you analyze other writers' arguments. Textbooks often present these three appeals together as "the rhetorical triangle" because all three work together (See Figure 5.3.4)

(Picture: triangle with pathos, ethos, and logos written one at each corner)

Figure: "Rhetorical Triangle" by Gabriel Winer is licensed under CC BY NC.

Who was Aristotle?

Aristotle (see Figure 5.3.5) was a Greek philosopher during the Classical period in Ancient Greece. Along with his teacher Plato, he has been called the "Father of Western Philosophy." His writings cover many subjects, including physics, biology, zoology, metaphysics, logic, ethics, aesthetics, poetry, theater, music, rhetoric, psychology, linguistics, economics, politics, and government. Aristotle brought together many prior philosophies. His views on physical science profoundly shaped medieval scholarship, and his works contain the earliest known formal study of logic. He influenced Islamic thought during the Middle Ages, as well as Christian theology. Aristotle was revered among medieval Muslim scholars as "The First Teacher" and among medieval Christians like Thomas Aquinas as simply "The Philosopher."

Video: "Ethos, Pathos, and Logos"

The following video by Ricky Padilla from Texas A&M University Writing Center explains more about the three rhetorical appeals:

Interactive Element

Video: https://youtu.be/aUpiy67_nt4

Identifying rhetorical appeals

Let's look at how these three appeals might be used in an essay:

Try this!

Imagine you are writing a paper to convince your readers that cheaply produced, low-quality clothing is a bad choice for consumers and that the clothing industry should be more regulated by governments. Here are some things you might include. Which ones are examples of *pathos*, *ethos*, or *logos*? (There is always some overlap, but look for clues: is the writer using emotion, senses, story? Are they working to appear fair, and to explain why we should trust a source? Are they presenting facts to support a claim?)

1. On March 25, 1911, a fire broke out in the Triangle Shirtwaist Company factory located next to Washington Square Park. With several of the main exits locked to prevent employees from stealing, only one exit was available and it was soon blocked by flames. Many workers succumbed to the heat and smoke while others, trapped by the growing fire, stepped out onto an eighth-floor ledge, and when the heat became unbearable, jumped off. Dozens of young women fell to their deaths on the pavement below, creating a horrific image that would transform the entire industry. It was the worst industrial accident in the history of the United States (Jimenez and Pulos).
2. Dr. Luz Claudio, the author of the study, is a neuroscientist, medical researcher, and professor of environmental medicine and public health at Mount Sinai University.
3. We can all agree that societies thrive when workers are paid enough to meet their basic needs. However, the workers in textile factories that supply fast fashion brands are paid as little as 40 cents an hour. Therefore, the practices of this industry are harming the societies where the factories are located.
4. Besides labor exploitation, another reason fast fashion is so destructive is that it leaves a pollution footprint, with each step of the clothing life cycle generating environmental hazards. For example, polyester, the most widely used manufactured fiber, is made from petroleum. With the rise in production in the fashion industry, demand for synthetic fibers, especially polyester, has nearly doubled in the last 15 years. The manufacture of polyester and other synthetic fabrics is an energy-intensive process requiring large amounts of crude oil and releasing emissions that can cause or aggravate respiratory diseases and contribute to the climate crisis. Other pollutants are released in the wastewater from polyester manufacturing plants, endangering the health of people in the surrounding communities (Claudio).
5. A 16-year-old walks into a brightly-lit store in a shopping plaza in Sacramento. She circles the racks full of crisp fabric, searching for a jacket that looks just like one from a recent fashion show in Paris. She finds it, looks at the tag, and is thrilled that it is in her size and only $19.99, but pauses momentarily. She remembers something she read on Twitter that gave her nightmares, about a girl her exact age dying in a fire in a garment factory in Bangladesh. She tries to remember if the store she is in was one of the brands the factory was supplying.
6. It's true that there has been some incremental progress toward improving working conditions. In order to reduce the destructive actions of the fashion industry, some clothing companies have signed agreements, and some governments have passed laws requiring better worker protections. However, we cannot depend on written agreements if the factories do not follow them. We must also listen to the voices of the workers, including in courts, as they are the ones most directly impacted. As a former child worker and a blacklisted union organizer who now leads the Bangladesh Center for Worker Solidarity, Kalpona Akter is certain: "Only a law that addresses the root causes of violations and has accountability at its core will truly transform and protect people's lives." She therefore calls on the Commissioners to introduce strong rules that also give victims of corporate abuses access to justice in European courts (Akter).

For suggested answers, see 5.12: Answer Key - Analyzing Arguments

Rhetorical appeals in various texts

Now let's apply this to your own reading and writing:

Apply this!

Look for examples of pathos, ethos, and logos in advertisements, public service announcements, news articles, websites, and books.

Consider a paper you are working on or a classmate's paper you are reviewing. How can the writer add or improve elements of pathos, ethos, and logos?

In the following sections, we will learn more about pathos, ethos, and logos, and how to apply this knowledge to your reading and writing.
